

CS 5610 Project 1 - Alexander Gutting

Project description:

The goal of this project was to create a portfolio page that showcases two projects focused on data analytics; a stock price predictor model and a topic distribution model. I included four webpages in the project: a home (index) page, one sub page for each data analysis project I created, and a contact information page, where the user is able to not only contact me via mobile phone, email, or LinkedIn, but also send a direct message to me through the website. This website was created with the use of VSCode, consisting of four HTML5 files and three JavaScript (ES6+) files (one for the home page, one for each project page, and one for the contact page), as well as one CSS3 file that is in charge of the styles of each class and header in all of the HTML files. It also includes two .png images (one image representing each individual project showcased in the website). The project was formatted with the use of Prettier (for all three programming languages) and validated with the use of Validator W3 (for both HTML and CSS). I plan on using this website for professional usage in the future for showcasing class projects that I developed during my time at Northeastern. I also plan on making significant changes to the website over the course of the semester as I continue to learn more about web development.

User Personas:

Claude Richardson (job recruiter at a successful tech startup with over 10 years of recruiting experience)

Scott Morris (graduate student at the Khoury ALIGN program at Northeastern University)

User stories (use cases but with a story):

- Claude is looking for a data science student with entry-level talent and has unique and outstanding portfolio projects. After reviewing several applicants' portfolio websites, Claude comes across my own and is intrigued by my work. He is also impressed with my skill in Python, Jupyter, and R, as well as my ability to work in a collaborative environment. Claude reaches out to me by sending me a direct message on my website and tells me that he is interested in an interview.
- Scott also has a knack for developing data analysis projects. Scott is looking for inspiration for developing his own personal portfolio website so he could stand out to other hiring managers and job recruiters. Scott happens to come across my portfolio website and decides to take a look at my work. He is curious about the development process of my projects. Scott reaches out to me by sending me an email and asks about the development process of my projects.
